I. INTRODUCTION

- **General presentation of the discipline: place and role of the discipline in the formation of the specific competences of the professional / specialty training program**

The course of molecular biology is an important part of preclinical education, and its main objective is to study the molecular structure of the cell - the basic structural, biochemical, functional level of the human body.

The content of the course is structured to demonstrate that living organisms, regardless of their complexity, including the human organism, have a common organizational principle, which determines them to be self-reproducing, self-renewing and self-regulating systems; the peculiarities of an organism structure and functions are encoded in DNA molecules and expressed through the synthesis of RNA molecules and proteins, which are the molecular substrate of all structures, properties and functions of the human body; DNA replication, repair, encoding genetic information, transcription and translation - fundamental processes that explain vitality; the dynamics of cellular components and molecular processes depending on cell cycle period, cell type and ontogenetic period of the body - the basis of human body development, cell differentiation and transformation.

- **Mission of the curriculum (aim) in professional training**

One of the main objectives of the course is to demonstrate the link between the structure and function of biopolymers, cell compartments, different cell types. The second objective is to evaluate the relationship in the chain: the function of a cellular component at the molecular →cellular → organism level. The third objective is to understand the medical role of DNA, RNA and proteins. It is important that any pathological process can be based on cellular changes: metabolic defects; structural defects; signaling defects; defects in cellular contacts; etc.

Knowing the organization and functioning of the cell / cells provides the medical student the chance to understand the mechanisms of human disease production and ways of solving pathological processes. 21st Century Medicine is MOLECULAR MEDICINE.

- **Language (s) of the course:** English.
- **Beneficiaries:** students of the 1st year, faculty Pharmacy, Specialty Pharmacy .

II. MANAGEMENT OF THE DISCIPLINE

Code of discipline	F.01.O.017.		
Name of the discipline	Molecular Biology		
Person(s) in charge of the discipline	Associate professor, PhD Igor Cemortan		
Year	I	Semester/Semesters	2
Total number of hours, including:			120
Lectures	30	Practical/laboratory hours	
Seminars	30	Self-training	60
Clinical internship			-
Form of assessment	E	Number of credits	4

III. TRAINING AIMS WITHIN THE DISCIPLINE

At the end of the discipline study the student will be able to:

at the level of knowledge and understanding:

- know the organization of biological systems;
- know the fundamental properties of life and its molecular organization;
- understand the principles of human cell compartmentalization, the characteristic features of each compartment, the set of characteristic molecules and the interrelationships between different cell organelles and the cells of a multicellular organism;
- know the relationship DNA-RNA-protein --- cellular structures and functions and their effects at the body level; to know the relationship Genome → Transcriptome → Proteome → Metabolome → Phenome;
- understand how the human genome is organized, the particularities of the storage, transmission and realization of genetic information at the molecular, cellular and body level;
- know the principles of basic molecular processes: transcription, translation, replication and repair;
- know the particularities of organization and functioning of the human cell vs. the bacterial cell;
- understand the basic processes that ensure the growth of the multicellular organism, cell differentiation, renewal and regeneration of tissues - mitosis and apoptosis.
- understand the basis of diversity of living organisms, intra- and inter-familial variability of the human organism – intra-chromosomal, inter-chromosomal and genomic recombination;
- know the basics of DNA technology, the principles of human gene study techniques.

at the application level:

- distinguish cellular forms of life from acellular;

CD 8.5.1 DISCIPLINE SYLLABUS FOR UNIVERSITY STUDIES

Edition: 09

Date: 08.09.2021

Page. 4/15

- distinguish the eukaryotic from the prokaryotic cell;
- model basic genetic processes: replication, transcription, translation;
- evaluate the practical role of recombinant DNA technology;
- distinguish separation of DNA and mRNA from human cells;
- interpret the results obtained by different DNA sequencing methods;
- interpret the results obtained by the PCR technique;
- interpret the results obtained by the Southern blot technique;
- read out the results of electrophoresis of DNA fragments obtained by various techniques.

at the integration level:

- assess the place and role of molecular biology in the pre-clinical training of the medical student;
 - use the knowledge and methodology of molecular biology to explain the nature of physiological or pathological processes;
 - make the link between structure and function at molecular level → at cellular level → at tissue level → at organism level;
 - deduce the possible causes of blocking the basic molecular processes and the consequences on the cell, tissue, organism as a whole;
 - implement the knowledge gained in the research activity;
 - use critically and with confidence the scientific information obtained using the new information and communication technologies;
 - use multimedia technology to receive, evaluate, store, produce, present and exchange information, and communicate and participate in networks via the Internet;
- learn to learn, which will contribute to the management of the professional development.

Page. 5/15	

IV. PROVISIONAL TERMS AND CONDITIONS

Requirements for first year students:

- knowledge of the language of studies;
- confirmed competences in sciences (biology, chemistry, physics) at the school level;
- digital competences (use of the Internet, document processing, electronic tables and presentations, use of graphics programs);
- ability to communicate and work in a team;
- qualities - tolerance, compassion, autonomy.

V. THEMES AND ESTIMATE ALLOCATION OF HOURS

Lectures, practical hours/ laboratory hours/seminars and self-training

No. d/o	THEME	Number of hours		
		Lecture s	Seminar s	Self- training
1.	Molecular biology as biological science. Importance of Molecular biology for medicine. Biological systems and their properties. Levels of organization of biological systems. Macromolecules. Interactions between macromolecules and their functions in biological systems. Nucleic acids – structure, properties, functions.	2	2	3
2.	Compartmentalization of eukaryotic cells. Synthesis, processing and sorting of macromolecules in eukaryotic cells. Degradation of the external and internal substances. Detoxification of xenobiotics and neutralization of drugs and toxic metabolites.	2	2	3
3.	Biological membranes and their molecular organization. Plasma membrane and intracellular membranes. Particularities of the internal cell membranes and their biogenesis. Transmembrane transport of substances. Membrane receptors. Cell junctions.	2	2	3
4.	Eukaryotic DNA: location and structure. Chromatin: euchromatin and heterochromatin. Molecular organization of chromatin. Levels of condensation of chromatin. Nucleolus: molecular organization and functions. Particularities of the prokaryotic cell structure.	2	2	3
5.	Replication and its biological role. Apparatus of replication. Peculiarities of replication in prokaryotes. Replication in eukaryotes. DNA repair in prokaryotes and eukaryotes: mechanisms and biological role. Replication of mitochondrial DNA.	2	2	3
6.	Structure of prokaryotic and eukaryotic genes. Coding, non-coding, regulatory and modulatory sequences. Structure and functions of the I st , II nd , III rd class genes. Mobile genetic elements.	2	2	3
7.	Transcription. Peculiarities of transcription in prokaryotes and	2	2	3

No. d/o	THEME	Number of hours		
		Lectures	Seminars	Self-training
	eukaryotes. Processing of RNA. Transcription of 1 st , 2 nd and 3 rd class genes. RNA splicing.			
8.	Translation and protein biosynthesis. Genetic code and its properties. Mitochondrial genetic code. Ribosomes – structure and functional sites. Particularities of translation in prokaryotes. Blocking of translation in prokaryotes. Particularities of translation in eukaryotes.	2	2	3
9.	Gene mutations. Spontaneous and induced mutations. Rate of mutations. Phenotypic consequences of gene mutations.	2	2	3
10.	Recombinant DNA methods. Isolation and purification of DNA and RNA. Cloning in vivo and in vitro. cDNA libraries.	2	2	3
11.	Methods of gene analysis. Gene sequencing. Southern, Northern and Western-blot analysis. PCR and its applications.	2	2	3
12.	Cell cycle. Steps of cell cycle: interphase in mitosis. Apoptosis. Examination of microscopic slides, images with different phases of mitosis. Dynamic of chromosomes during cell cycle. Control of cell cycle. Types of cell proliferation. Mitogen/Cytostatic action of some drugs.	2	2	3
13.	Defects of the molecular mechanisms cell proliferation and differentiation. Apoptosis.	2	2	3
14.	Genetic recombination. Meiosis and its periods. Gametogenesis. Dynamic of chromosomes during meiosis. Biological importance of meiosis. Particularities of gametogenesis in male and female. Errors of meiosis and fecundation.	2	2	3
15.	Basics of farmacogenetics and personalised medicine.	2	2	4
Total		30	30	60

VI. REFERENCE OBJECTIVES OF CONTENT UNITS

Objectives	Content units
Chapter 1. „Molecular organization of human cell”	
<ul style="list-style-type: none">• To define e biopolymers and cell compartments• to know the structure, properties and functions of biopolymers and their location in the cell• to demonstrate the principles of cell compartmentalization and the interaction between different compartments• to comment on the medical significance of biopolymers• to apply knowledge to other disciplines• to formulate conclusions, to develop own views on the biological and medical role of biopolymers and cell compartments	<ol style="list-style-type: none">1. Cell as a structural, functional and pathological unit of human organism.2. Nucleic acids as carriers of genetic information about organization and finctions of cell.3. Proteins – substrate of all structures, properties and functions at the level of cell, tissue, organism.4. Interactions between macromolecules, the role in integrity and normal activity of human cells.
Chapter 2. Main molecular proceses in cell	
<ul style="list-style-type: none">• To define gene, gene expression, transcription, processing, splicing, alternative splicing, translation, genetic code, replicon, replication, NER repair; BER repair• To know the peculiarities of organization of different human vs. prokaryotes genes; the peculiarities of the expression of nuclear vs mitochondrial vs bacterial genes;• to know the principles and the apparatus of transcription, processing and translation;• to know the peculiarities of nuclear vs. mitochondrial vs. prokaryotic DNA replication;• to demonstrate the peculiarities of GI expression and the importance of this knowledge in eukaryotes vs. prokaryotes• to model the expression of Class I, Class II, Class III genes and prokaryotic genes• to model the translation of the genetic code• to apply the gained knowledge in other subjects	<ol style="list-style-type: none">1. Structure and functions of genes. Coding, non-coding, regulatory and modulatory sequences. Mobile genetic elements.2. Transcription of genetic material. Steps of transcription. Apparatus of transcription. Processing of RNA. RNA splicing. Alternative splicing and its biological importance.3. Translation. Genetic code. Steps and apparatus of translation. Control of gene expression in eukaryotes. Levels of the control of gene expression. Control of gene activity on ontogenesis and cell specialization.4. DNA replication. Apparatus of replication. Peculiarities of replication in prokaryotes and eukaryotes. Synthesis of telomeres. Replication of mitochondrial DNA.5. DNA repair.
Chapter 3. Transmission of the genetic information from cell to cell, from parents to offspring	
<ul style="list-style-type: none">• To define interphase, mitosis, meiosis, gametogenesis, crossing-over, gametocyte, gamete, G0 period, somatic cell, STEM cell, apoptosis	<ol style="list-style-type: none">1. Cell cycle. Steps of cell cycle: interphase and mitosis. Interphase: sequence of main events. Mitosis. Dynamic of chromosomes during mitosis. Control of cell cycle. Restriction

**CD 8.5.1 DISCIPLINE SYLLABUS FOR
UNIVERSITY STUDIES**

Edition: 09

Date: 08.09.2021

Page. 8/15

Objectives

Content units

- to know the particularities of the cell cycle, the dynamics of the chromosomes in G1, S, G2, prophase, metaphase, anaphase, telophase;
 - to know the modality and particularities of the meiosis, the dynamics of the chromosomes during the reductional and equational divisions;
 - to know the particularities of apoptosis;
 - to understand the mechanisms of cell cycle control and cell transformation pathways;
 - to understand the particularities of the development of meiosis in oogenesis vs spermatogenesis;
- to demonstrate the medical role of knowing the cell cycle, apoptosis;

1. points. Types of cell proliferation. Period G₀. Malign transformation.
2. Apoptosis programmed cell death. Mechanisms of apoptosis. Biological importance of apoptosis. Control of apoptosis.
3. Recombination. Steps of meiosis: Reductional and equational divisions. Crossing-over and its biological importance. Dynamics of chromosomes during meiosis. Peculiarities of gametogenesis in male and female.

Chapter 4. Basics of the genetic engineering

- To define recombinant DNA, DNA cloning, in vivo cloning, in vitro cloning, restriction enzymes, molecular markers, synthetic primers, PCR
 - to know the principles, stages and components needed for recombinant DNA technology;
 - to know the particularities of cloning vectors and hosts;
 - to know the particularities of DNA cloning in vitro;
 - to understand the principles of genomic DNA and RNA isolation for different techniques;
 - to understand the principles of gene analysis techniques;
 - to model *in vivo* cloning and *in vitro* cloning of DNA
 - to model the PCR and the Southern-blot techniques
 - to interpret the results obtained by the PCR technique;
- to interpret the results obtained by the Southern blot technique.

1. Recombinant DNA technology. Restriction enzymes. Restriction maps. Cloning vectors: plasmids and bacteriophages.
2. Isolation and purification of DNA and RNA. DNA and genomic libraries.
3. Cloning in vivo and in vitro.
4. Methods of gene analysis. Gene sequencing. Southern, Northern and Western-blot analysis. PCR and its applications.

Edition: 09

Date: 08.09.2021

Page: 9/15

VII. PROFESSIONAL (SPECIFIC (SC)) AND TRANSVERSAL (TC) COMPETENCES AND STUDY OUTCOMES

CP1: Knowledge of the theoretical bases of the subject included in the faculty curriculum, of the general principles in the development, analysis and registration of pharmaceutical and paraprofessional products; knowledge of the general principles of organization and functioning of pharmaceutical institutions with different legal forms of activity; knowledge of the legislative framework in the field of pharmacy; knowledge of the pharmacist's rights and obligations.

CP4: determining the peculiarities and organizational culture of the pharmaceutical institution, where the pharmaceutical professionals carry out their activity; designing and coordinating the pharmaceutical activity in various institutions: open state or private pharmacies; hospital pharmacies; pharmaceutical warehouses; drug factories, laboratories for quality control and certification of medicines, etc.; active involvement in accomplishing the mission of the pharmaceutical institution; demonstrating the ability to make decisions aimed at improving the pharmaceutical system.

CP6: adopting messages to various socio-cultural backgrounds, including communication in foreign languages; ability to solve situation problems in the pharmaceutical activity through collaboration with physicians; promoting the principles of tolerance and compassion towards patients; using informational technology (and computers) in the pharmaceutical activity;

CT1: Promoting logical reasoning, practical applicability, evaluation and self-evaluation in decision making; compliance with the norms of ethics and pharmaceutical deontology in the preparation, analysis, transport and release of medicines to the population and medical institutions.

Study outcomes

- To know the organizational features, fundamental properties of life and the molecular basis of biological systems;
- To understand the principles of human cell compartmentalization;
- To understand the relationship Genome → Transcriptome → Proteome → Metabolome → Phenome;
- To know the principles and model the basic molecular processes: transcription, translation, replication and repair;
- To know the particularities of organization and functioning of the human cell vs. the bacterial cell;
- To understand the basic processes that ensure the growth of the multicellular organism, cell differentiation, renewal and regeneration of tissues - mitosis and apoptosis.
- To know the bases and the practical role of recombinant DNA technology, the principles of human gene study techniques.
- To be able to assess the place and role of molecular biology in the pre-clinical training of the medical student;
- To be competent to use the knowledge and methodology of molecular biology to explain the nature of physiological or pathological processes;
- To be able to deduce the possible causes of blocking the underlying molecular processes and their consequences on the cell, the tissue, the body as a whole;
- To be able to implement the knowledge gained in the research activity;

CD 8.5.1 DISCIPLINE SYLLABUS FOR UNIVERSITY STUDIES

Edition: 09

Date: 08.09.2021

Page. 10/15

- To be competent to use critically and with confidence the scientific information obtained using the new information and communication technologies.

conclusions, the elements of creativity, the personal attitude, the coherence of the exposure and the scientific correctness, the way of presenting

IX. METHODOLOGICAL SUGGESTIONS FOR TEACHING-LEARNING-ASSESSMENT

• *Teaching and learning methods used*

In teaching Molecular Biology are used various didactic methods and techniques, oriented towards the efficient learning and achievement of the objectives of the didactic process. During theoretical lectures, along with traditional methods (lecture-exposure, lecture-conversation, synthesis lecture), modern methods (lesson-debate, lecture-conference, problem-lesson) are also used. Forms of individual, frontal, group, virtual lab work are used in the practical classes. To learn the material in depth, different semiotic systems (scientific language, graphical and computerized language) and teaching materials (tables, diagrams, micro-pictures, transparent films) are used. During the lessons and extracurricular activities are used Communication Information Technologies - PowerPoint presentations, on-line lessons.

• *Recommended learning methods*

- **Observation** - Identification of elements characteristic to some structures or biological phenomena, describing these elements or phenomena.
- **Analysis** - Imaginary decomposition of the whole into component parts. Highlighting the essential elements. Studying each element as part of the whole.
- **Diagram / picture analysis** - Selection of required information. Recognition based on knowledge and selected information of the structures indicated in the diagram, drawing. Analysis of the functions / role of recognized structures.
- **Comparison** - Analysis of the first object / process in a group and determining its main features. Analysis of the second object / process and determining its main features. Comparing objects / processes and highlighting common features. Comparing objects / processes and determining differences. Establishing distinguishing criteria. Formulating conclusions.
- **Classification** - Identification of the structures / processes to be classified. Determining the criteria on which classification is to be made. Distribution of structures / processes by groups according to established criteria.
- **Scheme drawing** - Selection of elements, which must be included in the scheme. Showing the selected elements through different symbols / colors and showing their relationships. Formulating an appropriate title and legend for the symbols used.
- **Modeling** - Identifying and selecting the elements needed for modeling the phenomenon. Imaging (graphically, schematically) the phenomenon studied. Realizing the phenomenon using the developed model. Formulating conclusions, deduced from arguments or findings.
- **Experiment** - Formulating a hypothesis, based on known facts, on the process / phenomenon studied. Verifying the hypothesis by performing the processes / phenomena studied under laboratory conditions. Formulation of conclusions, deduced from arguments or findings.

**CD 8.5.1 DISCIPLINE SYLLABUS FOR
UNIVERSITY STUDIES**

Edition: 09

Date: 08.09.2021

Page. 13/15

- **Applied teaching strategies / technologies (specific to the discipline)**
"Brainstorming", "Multi-voting"; "The round table"; "Group Interview"; "Case Study"; "Creative Controversy"; "Focus-group technique", "Portfolio".
Virtual Practices

- **Methods of assessment (including the method of final mark calculation)**
 - ✓ **Current:** frontal and / or individual control through
 - (a) applying docimological tests,
 - (b) solving problems / exercises,
 - (c) analysis of case studies
 - (d) performing role-plays on the topics discussed.
 - (e) tests

Final: exam

The **final mark** will consist of the average mark of three concluding tests and the semester scientific project (50%), and the final test in computerized system (50%).

The average mark and the marks of all the final exam stages (computer, written test) - will be expressed in numbers according to the marks scale (as in the table) and the final mark obtained will be expressed in two decimals and will be written in the marks book.

**CD 8.5.1 DISCIPLINE SYLLABUS FOR
UNIVERSITY STUDIES**

Edition: 09

Date: 08.09.2021

Page. 14/15

Method of mark rounding at different assessment stages

Intermediate marks scale (annual average, marks from the examination stages)	National Assessment System	ECTS Equivalent
1,00-3,00	2	F
3,01-4,99	4	FX
5,00	5	E
5,01-5,50	5,5	
5,51-6,0	6	
6,01-6,50	6,5	D
6,51-7,00	7	
7,01-7,50	7,5	C
7,51-8,00	8	
8,01-8,50	8,5	B
8,51-8,00	9	
9,01-9,50	9,5	A
9,51-10,0	10	

The average annual mark and the marks of all stages of final examination (computer assisted, test, oral) - are expressed in numbers according to the mark scale (according to the table), and the final mark obtained is expressed in number with two decimals, which is transferred to student's record-book.

Absence on examination without good reason is recorded as "absent" and is equivalent to 0 (zero). The student has the right to have two re-examinations.
